

# When should I replace my server?

If you have had your server for 5 years or more and you notice that it has become under powered for your requirements. However, other signs are:

1. High maintenance costs and constant fixes because of failing components.
2. Longer periods of down time and reboots are constantly required.
3. It is slow, running at maximum capacity and reaches a high temperature.
4. If you are having problems where staff can not access data, or backups are not completing
